

ABSTRACT OF THE DISCLOSURE

A soft connector link is disclosed for connecting a first item to a second item such as canopy suspension lines to a canopy riser. In a first embodiment, the soft link preferably includes a flexible body member having a first looped end and a second looped end. A tab member is preferably attached or secured to the second looped end. The soft link is preferably constructed from a rope-like material such as high strength fiber. In an alternative embodiment, the second end of the body member is tabbed or lumped, as opposed to being looped. Two attachment methods for using the soft link as a connector are also disclosed and illustrated.
